

Summary

1 minute

In this module, you've learned how to use SQL to store and retrieve data in Azure SQL Database, Azure Database for PostgreSQL, and Azure Database for MySQL. You've seen how to connect to these database management systems using some of the common tools currently available.

Clean up

The sandbox automatically cleans up your resources when you're finished with this module.

When you're working in your own subscription, it's a good idea at the end of a project to identify whether you still need the resources you created. Resources left running can cost you money. You can delete resources individually or delete the resource group to delete the entire set of resources.
