Summary

1 minute

In this module, you've learned how to provision and deploy relational databases using different types of data stores. You've seen how you can deploy Azure data services through the Azure portal, the Azure CLI, and Azure PowerShell. You've also learned how to configure connectivity to these databases to allow access from on-premises or within an Azure virtual network. You've also seen how to protect your database using tools such as the firewall, and by configuring authentication.

Additional resources

- Create an Azure Database for PostgreSQL
- Create an Azure Database for MySQL
- Create an Azure single Database
- Azure SQL Database documentation
- PostgreSQL Server parameters
- PostgreSQL extensions in Azure Database for PostgreSQL - Single Server
- How to configure server parameters in Azure Database for MySQL by using the Azure portal
